

REPORT OF EXAMINATION OF ALASKA SALMON STREAM

Name of stream. Mineral Lake Creek. Date examined July 9.

Location North Arm, Moira Sound Pr. of Wales Island. Alaska.

Approximate length $\frac{1}{2}$ mile. Width 30 feet Depth 1 foot.

Condition and stage (Whether clear, high, low, etc.) Clear, High on July 9.

Lakes, if any, size, character, and whether accessible from sea. Mineral Lake, 2 Mi. long and $\frac{1}{2}$ Mi. wide, and a boat can very nearly go up into the Lake.

Salmon run (heavy, light, average, etc.) Light.

Date and duration of run of each species Dog salmon showing August 7.

Estimated number of each kind of salmon on spawning beds or in stream.

Former size of runs of each species and evidence of depletion, if any. The stream has been fearfully depleted and there are hardly any red salmon now.

Natural barriers and whether removable None.

Where markers are placed. Just below Marble Quarry.

Remarks, sketches, etc. Do not remember what this stream was good for, but it used to be one of the large streams much the same as Kegan. I have no doubt there are times at spring tides where a rowboat can be pulled up into the lake, but do not remember seeing it done, ordinarily the lake is only a couple of feet higher than at W. spring.

H.J. Hanson, Watchman.
